

DimensionsPro Project Roadmap

Next steps toward a web/phone-based contractor tool that measures windows and doors, generates verified estimates, and helps close jobs on the first visit.

1. Stabilize Testing Ground • testing branch by default • TEST web link for previews • main remains official/stable	2. Fix Cloud Data Reliability • Confirm Supabase source of truth • Load saved projects from Supabase • Visible sync + manual refresh • Protect against local-only project loss	3. Scale-Assisted Scanner • Credit card / 1-inch marker for now • Better capture instructions • Valid image data to vision scanner • Width, height, type, confidence • Contractor confirms before saving
4. Verification UI • Clear detected dimensions • Manual correction • AI value vs confirmed value • Low-confidence flags	5. Product Catalog • Vinyl / Aluminum / Fiberglass • Window and door types • Glass, grids, tempered, hardware • Install type rules	6. Estimate Engine • Material pricing • Labor pricing • Options and upcharges • Markup, tax, discounts • Good / better / best
7. Scope of Work • Customer-facing scope • Installer notes • Assumptions and exclusions • PDF / CSV quote-ready export	8. Field Close Workflow • Review measured openings • Generate quote on-site • Present price and scope • Approval/signature later	9. Improve AI Over Time • Save photos + confirmed measurements • Build training/evaluation dataset • Measure scanner accuracy • Eventually test no-scale measurement

Flow: 1 -> 2 -> 3 -> 4 -> 5 -> 6 -> 7 -> 8 -> 9

Recommended Order

1. Cloud reliability first

Make sure projects save/load correctly from Supabase on the TEST web app. If saved jobs disappear or only live in browser storage, everything else becomes shaky.

2. Scanner reliability second

Keep the credit card or 1-inch marker requirement. The goal is not no-scale yet. The goal is: photo in, measurement suggestion out, contractor confirms.

3. Verification screen third

Never let AI measurements silently become final. Show the result, confidence, and allow correction.

4. Pricing/catalog fourth

Once measurements are dependable, add the dealer product rules: material, type, glass, grids, install type, labor.

5. Estimate and scope fifth

Turn confirmed openings into a customer-ready quote and scope of work.

6. Close-on-site workflow last

Make the app feel like a sales tool: measure, review, estimate, present, close.

Next Milestone

Projects reliably save/load in Supabase, then DimensionSnap produces verified scale-assisted measurements on the TEST web app.
